

Operating Manual

Cooling unit EVO 45

Type: WKL 390

Article no.: 0390.013

3x460V, 60Hz

The Perfect
Match
Is Our Business

the smart way of cooling!

Safety notice

First carefully read through this operating manual.

Pay particular attention to the safety instructions contained in chapter [2 Safety](#), before performing work on the cooling unit.

The work described in this operating manual must only be carried out by persons who fulfil the personnel qualifications listed at the start of the corresponding chapter.

Follow the safety notes, keep to the handling instructions and follow the described handling processes.

Foreword

This operating manual enables users to correctly operate the cooling unit described in all life phases and without danger.

1 General information

1.1 Purpose of this operating manual

Using this operating manual, users can operate the cooling unit safely and carry out the work described safely and correctly.

1.2 Target groups

The target groups of this operating manual are all persons who work on or with this cooling unit in the course of the various life phases. The requirements placed on the target groups are described in the respective personnel qualifications of the active chapter.

Packing/Transport: Shipping and transport experts

Assembly: Fitters

Commissioning: Service technicians

Operating: Operating specialists

Maintenance: Plant mechanics

Repair: Plant mechanics

Plant electricians

Refrigeration technicians (with certificate for refrigerant)

Troubleshooting: Plant mechanics

Plant electricians

Refrigeration technicians (with certificate for refrigerant)

Disassembly: Fitters

Disposal: Refrigeration technicians (with certificate for refrigerant)

Specialists with knowledge of legislation and materials

1.3 Explanation of symbols and abbreviations

1.3.1 Product-specific designations

Refrigerant circuit

Closed refrigerant circuit in which the refrigerant circulates.

Water circuits

Open refrigerant circuit with integrated, high capacity tank.

1.3.2 Abbreviations used

The international SI unit system is basically used for the physical units, including:

A	Ampere
bar	Pressure
K	Kelvin
kg	Kilogram
kW	Kilowatt
Rxxxx	Refrigerant (e.g. R407C)
V	Volt
V_{AC}	AC voltage
V_{DC}	DC voltage

2 Safety

This chapter contains safety-relevant codes of conduct and procedures that are necessary for safe operation and which must be adhered to.

2.1 Appropriate use

The cooling unit is used exclusively to cool and heat the medium specified in the technical data within the specified temperature limits. The quality of the medium must comply with the specifications of the laser equipment manufacturer.

Any other use is deemed to be incorrect use.

2.2 Incorrect use

Non-adherence to the following points is deemed to be incorrect use:

- this operating manual and the technical data contained therein
- the operating conditions
- the work processes
- the maintenance work

The following also count as incorrect use:

- Operation in explosive or inflammable atmospheres
- Storage and transport of the equipment where there is a danger of frost, without completely draining the tank and the pumps.

The manufacturer's warranty becomes automatically void for any damage due to incorrect use. Any claims for compensation for damage caused by incorrect use shall not be accepted by the manufacturer.

2.3 Hazards due to incorrect use

No hazards due to incorrect use are known.

2.4 Meaning of hazard warnings

The following hazards are residual hazards that cannot be eliminated in concept or design with suitable safety devices.

These residual hazards have been divided into the following groups according to severity and frequency:

	Danger These safety instructions warn of dangers which can result in fatal physical injury if not observed.
-------------------------------------------------------------------------------------	-----------------------------------------------------------------------------------------------------------------------

	Warning These safety instructions warn of dangers which can result in serious physical injury if not observed.
-------------------------------------------------------------------------------------	--------------------------------------------------------------------------------------------------------------------------

	Caution These safety instructions warn of dangers which can result in minor physical injury or material damage if not observed.
-------------------------------------------------------------------------------------	-------------------------------------------------------------------------------------------------------------------------------------------

	Note These notes warn of risks where proper functioning or specified performance parameters cannot be achieved if not heeded.
-----------------------------------------------------------------------------------	-----------------------------------------------------------------------------------------------------------------------------------------

2.5 Authorisation of personnel

The work described in this operating manual must only be carried out by specifically authorised personnel.

Only persons who fulfil the requirements under the "Personnel Qualification" entry of the individual main chapter are authorised.

2.6 Personal protection

	Warning The refrigerant in the refrigerant circuit is pressurised. Protective goggles and safety gloves must be worn when working on the refrigerant circuit. Escaping refrigerant can lead to serious injury of the eyes and skin as well as respiratory distress (displacement of oxygen in the air).
-----------------------------------------------------------------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

- Prior to commissioning of the cooling unit, always check that all safety devices are fitted correctly and that all protective covers are closed.
- Before any service work, the cooling unit must be switched off and secured against being switched back on without authorisation. All sources of energy such as:
 - Electricity must be disconnected.
 - Refrigerant: Before working on the refrigerant circuit, the refrigerant must be properly removed and the circuit depressurised.
 - Water: The water must be drained before working on the water circuit.

2.7 Hazard areas

No hazard areas are specified in and around the cooling unit.

	Note A loss of power or switching off the main switch when there is a danger of frost and with the unit filled with water can lead to damage of the unit.
-------------------------------------------------------------------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------

2.8 Personal protective equipment

The following personal protective equipment must be worn when working on the refrigerant circuit of the cooling unit:

- Protective goggles
- Safety gloves

2.9 Handling of pressure vessels

Note

All work on the refrigerant circuit must be carried out by trained refrigeration specialists. Comply with the local laws and regulations.

The refrigerant circuit and its components are pressurised. The associated pressure vessel ordinances must be adhered to in this area.

2.10 Medium quality

The operating medium to be used is defined in Chap. 13.1 Technical data.

Only fill in a mixture of 33 % propylenglycol / 67 % clean water.

2.11 Safety notices on the product

Safety notices on the product must always be kept in a legible condition. Fallen or missing safety notices must be replaced or reinstalled immediately in accordance with the following description.

Fig. 2.1 Warning of electrical voltage

2.12 Protective devices

Before each commissioning, make sure that all protective devices are fitted correctly and their protective function is in full working order.

2.12.1 Main switch

When the main switch is switched off the cooling unit is de-energized. The main switch is built into the control cabinet door.

2.12.2 Refrigerant circuit

The refrigerant circuit is equipped with the following safety devices:

Low-pressure transmitter (ND)

The low-pressure transmitter monitors the suction side against impermissibly low operating pressure in the refrigerant circuit. If there is a malfunction, the controller switches the compressor off and signals this on the display. Cooling is switched back on after the alarm on the display has been acknowledged. When the device is switched on again, the alarm is delayed.

(See also Chap. [7.1.3 Troubleshooting at operator level](#) and [9.4 Troubleshooting at repair level](#)).

High-pressure transmitter (HD)

The high-pressure transmitter monitors the pressure side against impermissibly high operating pressure in the refrigerant circuit. If there is a malfunction, the controller switches the compressor off and signals this on the display. Cooling is switched back on when the refrigerant circuit has cooled sufficiently and the alarm on the display has been acknowledged.

(See also Chap. [7.1.3 Troubleshooting at operator level](#) and [9.4 Troubleshooting at repair level](#)).

High-pressure safety pressure switch (HDS)

The high-pressure safety pressure switch protects the pressure side against impermissibly high operating pressure in the refrigerant circuit. If there is a malfunction, the high-pressure safety pressure switch turns off the compressor and signals the malfunction on the display. Cooling is switched back on when the refrigerant circuit has cooled sufficiently and the alarm on the display has been acknowledged.

(See also Chap. [7.1.3 Troubleshooting at operator level](#) and [9.4 Troubleshooting at repair level](#)).

2.12.3 Medium circuit

The medium circuit is equipped with the following safety devices:

Flow meter

The flow meter monitors the evaporator for impermissibly low flow-through, i.e. for freezing due to low flow speed.

The flow meter also protects the pump against running dry. If there is a malfunction, the controller switches off the pump (as well as the cooling) and shows the malfunction on the display. Cooling is switched back on after the alarm on the display has been acknowledged.

(See also Chap. [7.1.3 Troubleshooting at operator level](#) and [9.4 Troubleshooting at repair level](#)).

Evaporator outlet sensor

The evaporator outlet sensor monitors the evaporator for impermissibly low outlet temperature of the water. If there is a malfunction, the controller switches the compressor off. This is shown on the display. Cooling is switched back on after the alarm on the display has been acknowledged.

(See also Chap. [7.1.3 Troubleshooting at operator level](#) and [9.4 Troubleshooting at repair level](#)).

Float switch with low and high switch point

The low switch point monitors the water fill level in the tank. Thus temperature constancy in the water outlet, and the dry run protection of the pump are achieved. If there is a malfunction, the controller switches off the pump and also the cooling and signals the malfunction on the display. The cooling is switched back on after water is topped up and the alarm on the display has been acknowledged.

(See also Chap. [7.1.3 Troubleshooting at operator level](#) and [9.4 Troubleshooting at repair level](#)).

Float switch high

The high switch point outputs a warning on the PLC display. Top up water to "Max." marking.

2.12.4 Monitoring devices

Motor protection switches – compressor, pump, fans

If there is increased motor power and if there is a short circuit, the motor protection switch switches off and interrupts the power supply. The fault is shown on the display. The cooling is switched back on after the fault has been cleared and the alarm on the display has been acknowledged.

(See also Chap. [7.1.3 Troubleshooting at operator level](#) and [9.4 Troubleshooting at repair level](#)).

Microprocessor-controlled programmable logic controller (PLC)

The PLC regulates the temperature and monitors the excess temperature or insufficient temperature. If the water temperature is too high or too low, the controller switches the laser enable off and shows the malfunction on the display. The laser is enabled after the water is back in the operating range and the alarm on the display has been acknowledged.

(See also Chap. [13-57 PLC manual](#), [7.1.3 Troubleshooting at operator level](#) and [9.4 Troubleshooting at repair level](#)).

Monitoring the air filters

The high-pressure transmitter monitors the system pressure on the high-pressure side. If the condensation pressure is outside of the normal work range but within the limit value, the display shows a warning.

(See also Chap. [13-57 PLC manual](#), [7.1.3 Troubleshooting at operator level](#) and [9.4 Troubleshooting at repair level](#)).

2.12.5 Temperature regulator devices

Microprocessor-controlled_programmable logic controller (PLC)

Temperature control and regulation of the water circuit are handled by the PLC. The PLC regulates the water temperature depending on the set setpoint. The tank temperature is shown on the display.

(See also Chap. [13-57 PLC manual](#), [7.1.3 Troubleshooting at operator level](#) and [9.4 Troubleshooting at repair level](#)).

2.13 Use of original spare and wear parts

Only original spare parts may be used. Proper functioning of the cooling unit can no longer be guaranteed by the manufacturer if third party spare parts are used. In such cases, all warranty claims are automatically void.

2.14 Safety concept

This cooling unit is part of a wider system and must consequently be integrated in the safety concept of the wider system.

2.15 Duty to instruct of the operating company

The operating company of this cooling unit is responsible for ensuring that replacement personnel attend the customer training course and are informed of all hazards.

2.16 Duty to inform of the operating company

The operating company of this cooling unit is obligated to inform the manufacturer when selling the cooling unit and to disclose the new operating company.

The operating manual is part of the cooling unit and must accompany it.

2.17 Noise emission

The emission sound pressure level is specified in the Technical data.

See Chap. [13.1 Technical data](#)

3 Description

3.1 Identification

3.1.1 Nameplate

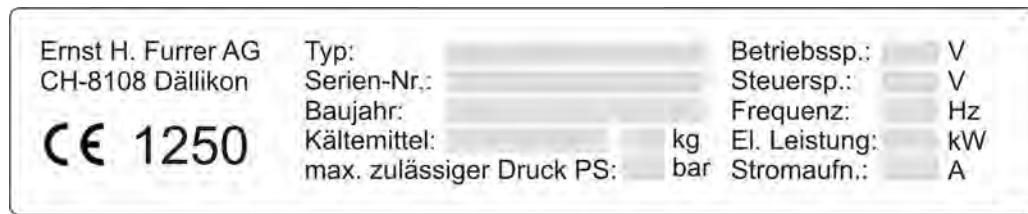

Fig. 3.1 Installation of the nameplate

Position of the nameplate

The nameplate is located top left on the front of the cooling unit. A copy of this is also attached in the control cabinet.

Fig. 3.2 Position of the nameplate

3.1.2 Model variants

- Mains voltage / frequency

See type plate and Chap. [13.1 Technical data](#)

3.2 Setup and function

3.2.1 Overview

The cooling unit is a ready-to-connect device and essentially consists of the housing, the components of the refrigerant circuit, cooling air and medium circuit, the control cabinet, and all control, regulating and monitoring devices that are necessary for automatic operation.

The operating medium to be used is defined in Chap. [13.1 Technical data](#).

3.2.2 Controller

The programmable logic controller (PLC) is responsible for safety, monitoring, control and regulation of the entire cooling unit (see also Chap. [7 Operation](#)).

3.2.3 Refrigerant circuit

The refrigerant circuit is a closed system in which the refrigerant circulates. In the plate evaporator the process heat is transferred from the medium circuit to the refrigerant circuit at low evaporation temperature, with the refrigerant transported through the compressor to the condenser where it is dissipated to the ambient air at a high condensing temperature or to a water circuit.

Components of the refrigerant circuit: See Chap. [13 Technical documents](#)

3.2.4 Medium circuit

Medium circuit with tank

Through the installed tank, the medium circuit is designed as a system that is open to the atmosphere. The generously dimensioned tank increases the constancy of the medium outlet temperature. The pump conveys the medium out of the tank to the consumer, where it is heated, and via the evaporator, which it is cooled, back to the tank.

Components of the medium circuit: See Chap. [13 Technical documents](#)

4 Packing and transport

4.1 Safety

	<p>Danger</p> <p>Suspended loads can fall.</p> <p>Never step or remain under suspended loads.</p> <p>Non-observance of this instruction can lead to fatal injury.</p>
-----------------------------------------------------------------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

	<p>Danger</p> <p>Unsuitable or under-dimensioned lifting gear can break and the load can fall.</p> <p>Only use suitable lifting gear with the required lifting capacity (see weight specifications in Chap. 13.1 Technical data). Only suspend the cooling unit on the suspension straps provided.</p> <p>Non-observance of this instruction can lead to fatal injury.</p>
-----------------------------------------------------------------------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

	<p>Caution</p> <p>Material damage due to frost.</p> <p>Transport or storage in a frost-exposed environment leads to material damage if the water circuits have not been fully drained beforehand.</p>
-------------------------------------------------------------------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

4.1.1 Personnel qualification

This cooling unit must only be packed and transported by personnel who fulfil the following requirements:

- Have read and understood Chap. 2 Safety
- Experience in or introduction into the areas of packing and transport

4.2 Preparations for transport

4.2.1 Emptying (frost protection)

Storage and transport in environments subject to freezing

The tank, pump and water circuit must be fully emptied prior to storage.

Unscrew the filter cup. **Make sure that the O-ring doesn't get lost.**

Emptying the pump

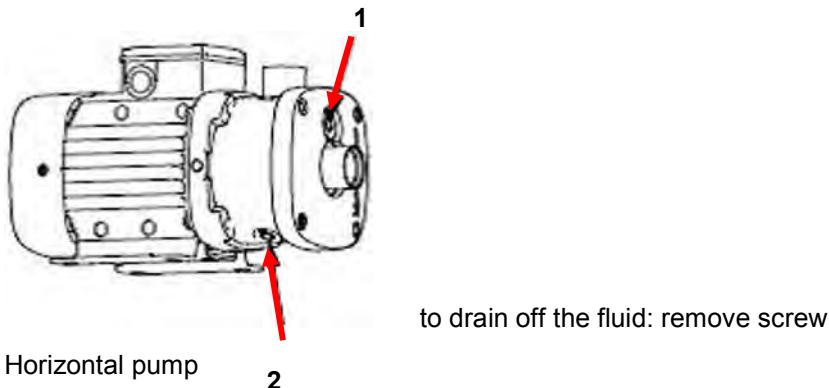

Fig. 4.1 Emptying the pump

- 1 Removal of rest air
- 2 Opening for draining

Procedure:

1. Remove screw (see Fig. 4.1).
2. Empty completely the pump for avoiding any damages.

After complete draining reinsert the filling plug and drain screw into the pump

Install and fit the water filter back into the filter cup.

4.3 Packing

The unit is screwed provided with suitable packing for overland transport.

4.4 Transport

Transport-specific data

See Chap. 13.1 Technical data for weight and dimensions. The cooling unit must be secured to prevent shifting and tipping in all cases. The cooling unit must be upright and contain no medium when transported.

Transport damages

Upon receipt, the cooling unit must be immediately checked for damage incurred in transit. Transport damage must be noted on the delivery note and the shipping agent notified immediately. A damaged cooling unit must not be put into operation.

Once delivered, the cooling unit must be transported using a forklift truck or a crane. During transport, ambient temperatures of +5 to + 63 °C are permissible. Lower temperatures only after completely emptying the water circuit (see Chap. 4.2.1 Emptying (frost protection)).

Transportation by forklift truck

Maintain a slow lifting speed.

Pay attention to the unit's centre of gravity, so that it does not tip over.

Transportation by crane

Where provided, the suspension eyelets (4-point attachment) must be used for transportation by crane.

Fig. 4.2 Suspension eyelets

Lifting equipment

Cables (cable suspension gear) per DIN 3088 or chains (chain suspension gear) per DIN 5687/5688. Both forms of lifting equipment fulfil the necessary requirements for attachment with even cable or chain lengths.

Cable inclination angle

The cable inclination angle to the vertical must not exceed 45°.

Lifting speed

Maintain a slow lifting speed (precision hoist, jolt-free lifting).

Setting down the cooling unit

In order to avoid an uncontrolled deformation of the housing frame, the cooling unit should be set down on a level surface.

Transportation by lorry

The load and the cooling unit must be secured to prevent shifting, tipping, and lifting in all cases. Transportation on roads with surface damage or unmade roads requires special measures and an appropriate driving manner to avoid damage to the cooling unit.

5 Installation and assembly

5.1 Safety

	Danger Suspended loads can fall. Never step or remain under suspended loads. Non-observance of this instruction can lead to fatal injury.
-----------------------------------------------------------------------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------

	Note Free intake and blow-out of the cooling air and an adequate air exchange for heat dissipation from the assembly site of the cooling unit must be ensured.
-----------------------------------------------------------------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

5.1.1 Personnel qualification

This cooling unit must only be installed and fitted by personnel who fulfil the following requirements:

- Have read and understood Chap. [2 Safety](#)
- Have completed basic mechanical and electrical training

5.2 Energy connections

The energy connections must be provided by the operating company. Refer to Chap. [13.1 Technical data](#) for the required energy connections and connecting points.

The operating company is responsible for ensuring that the electrical connections are safeguarded and implemented in accordance with the country-specific regulations.

The cooling unit must be connected in accordance with the electrical diagram supplied.

5.3 Installation

The cooling unit must be installed in a frost-free room on an even, horizontal surface and with the requisite load-bearing capacity. There is no requirement for securing the foundations, the use of underliners or vibration absorbers. Pipes must be flexibly connected with the cooling unit by means of compensators or hoses.

Operation in frost conditions and installation outdoors require additional measures:

- Optional heating kit and permanent power supply
- Weather-resistant housing, rain protection
- Suitable antifreeze mixture

Observe the minimum distances during installation in order for the cooling unit to function in a fault-free manner.

See Chap. [13.4 Drawings](#)

5.4 Assembly

Place the cooling unit at the intended position and secure against shifting.

For unit-specific connections, see Chap. 13.1 Technical data

5.4.1 Electrical connection

	Note Make sure that the electrical feed is shut off throughout the assembly period.
-----------------------------------------------------------------------------------	---------------------------------------------------------------------------------------------------

Connect the power feed cable (terminal X1)

Connect the communication cable (terminal X3).

5.4.2 Connecting the remote control

The cooling unit is prepared for connection of a remote control with potential-free group alarm, ON-OFF and enable (see electrical diagram).

5.4.3 Connections of the medium circuit

Connect the water hoses in accordance with the labelling on the cooling unit (inlet/outlet) and secure with hose clips.

The line nominal widths for the external medium circuit must be determined based on the available pump pressure and the expected loss in pressure in the consumer circuit. The medium lines can be implemented with a fixed or flexible design.

Ensure material compatibility throughout the entire medium circuit. The following materials can be installed in the water circuit in the cooling unit:

- Copper
- Stainless steel
- Brass
- Plastic
- Nitrile elastomer

Depending on the materials used in the external water circuit, (outside of the unit, customer-provided installation), material incompatibilities can cause corrosion damage.

Pay particular attention in this regard if using galvanised and aluminium materials.
If in doubt, consult qualified specialist companies.

	Note When connecting the medium circuit, avoid contamination in the external line system (rinse the lines prior to connecting).
-------------------------------------------------------------------------------------	-----------------------------------------------------------------------------------------------------------------------------------------------

6 Commissioning

6.1 Safety

	Danger Caution - dangerous voltage! Before commencing commissioning, switch off the main switch and secure against being switched back on without authorisation. Non-observance of this safety instruction can result in electrocution with fatal physical injury.
-----------------------------------------------------------------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

6.1.1 Personnel qualification

This cooling unit must only be installed and placed in operation by personnel who fulfil the following requirements:

- Have read and understood Chap. [2 Safety](#)
- Have completed basic mechanical and electrical training

6.2 Venting the pump

	Note Before filling the medium tank, remove the filter cup so that the pump is vented. (See Chap. 6.4.1.2 Commissioning the medium circuit)
-------------------------------------------------------------------------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

6.3 Checks prior to commissioning

- All transport aids and assembly fixtures are removed
- Filter cup removed (see Chap. [6.2 Venting the pumps](#))
- Electrical connections connected correctly (see Chap. [5.4.1 Electrical connection](#))
- All motor protection switches at "0" position
- Connections of the medium circuit are connected correctly (see Chap. [5.4.3 Connections of medium circuit](#))

6.3.1 Oil sump heater (optional)

At temperatures below 10 °C, switch on the oil sump heater for 2 hours prior to commissioning. To do so, set the motor protection switch of the controller power and the heaters to the "I" position and turn on the main switch. The other motor protection switches remain switched off. (See Chap. [13.6 Electrical circuit diagram](#))

6.4 Procedure for commissioning

6.4.1 Medium circuit

6.4.1.1 Medium requirements

The operating medium to be used is defined in Chap. [13.1 Technical data](#).

Only pour in a mixture of 33 % propylenglycol / 67 % clean water.

6.4.1.2 Commissioning the medium circuit

Actions required:

- Main switch "ON"
- All motor protection switches in "0" position except the motor protection switch for the controller power in "I" position (see electrical diagram")
- Undo the filter cup of the water filter with the filter wrench and remove. **Make sure that the O-ring doesn't get lost.**
- The filter cup must be removed so the pump can vent
- Remove the tank lid
- Fill the tank with the operating medium to the "Max" mark
- Install the filter cartridge in the corresponding filter cup
- Make sure that the O-ring sits uniformly in the groove of the filter cup

Venting the pumps:

- Pump equipped with a bypass is vented automatically.

Commissioning the pumps is only possible if the low level switch is covered with water.

- Motor protection switches of the pumps in the "I" position (see electrical diagram)
- Acknowledge alarm
- Switch on the pump via the remote control
- Check the specified direction of rotation of the pump

	Note If the direction of rotation of the cooling unit is wrong, de-energise the cooling unit and swap the 2 phases of the <u>main connection cable</u> .
-------------------------------------------------------------------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------

- While there is air in the pipelines, a flow alarm appears. The alarm can be acknowledged after waiting one minute. This process must be repeated until there is no flow alarm message on the display.
- Visually inspect the entire water circuit for leaks
- Check the water level again (via the high level switch) and top up water to the "Max." mark if necessary
- Fit the tank lid
- Check the setpoint adjustment of the temperature regulator in accordance with the project specification and correct the setpoint adjustment as needed

6.4.2 Refrigerant circuit

- After executing the tasks on the water circuit, all motor protection switches must be placed in the "1" position (see electrical circuit diagram)
- Acknowledge alarm
- The cooling unit is ready for operation and the temperature controller takes over regulation of the water temperature

	Note: Winter kit option
<p>If there is danger of freezing, the main power (main switch <u>and</u> main power supply) should <u>never</u> be switched off!</p>	

6.4.3 Operating state "Total Off"

The cooling unit is completely switched off

Main current: OFF (main switch)
External enable: OFF

In this operating state the cooling unit reacts neither to excess temperature nor insufficient temperature.

	Note: Winter kit option
<p>Frost protection is not guaranteed in this operating state. Ambient temperature of at least +5 °C. The tank and all water circuits may need to be <u>completely</u> emptied (see Chap. 4.2.1 Emptying (frost protection))!</p>	

7 Operation

The refrigeration system is set up for automatic operation. No interventions by the operating company or user are intended.

External switch on/off commands are issued via potential-free contacts (see electrical diagram). The setpoint can be set on the display.

7.1.1 Personnel qualification

This cooling unit must only be operated by personnel who fulfil the following requirements:

- Have read and understood Chap. [2 Safety](#)
- Have undergone introduction as an operator of the system

7.1.2 Description of the PLC

The cooling unit is ready for operation and can be placed in service directly or via the remote control. The PLC regulates the temperature of the cooling medium, and controls and monitors and the cooling unit. The cooling unit is fully automatic.

For information on operating the PLC, see Chap. [13.7 PLC manual](#)

7.1.3 Troubleshooting at operator level

N.B. The messages shown on the display may differ from those in this table or may not appear as stated, depending on the unit and application.

Warning: The cooling unit continues running. **Alarm:** The cooling unit shuts down.

The fault for the latest event is displayed. The arrow keys can be used to display other pending fault messages. To ensure rapid and effective resolution, please tell Support about all of the pending messages.

From the main menu, press the Alarm key once: The latest pending message is displayed

The messages can be acknowledge by pressing the Alarm key twice. Faults which are still pending will be shown again, either immediately or after a delay.

Return to the main menu with the ESC key.

Warning	Possible causes	Remedy
Warning 13.1. MEDIUM CIRCUIT OVERTEMPERATURE	<ul style="list-style-type: none"> – Insufficient cooling capacity – Other causes 	<ul style="list-style-type: none"> – Control signal cooling should show 100% – There should be no bubbles in the sight glass of the refrigerant circuit – Check if any other alarm messages are pending – Request Customer Service
Warning 70 WATER LEVEL INSUFFICIENT	<ul style="list-style-type: none"> – Insufficient water level – Leakage 	<ul style="list-style-type: none"> – Top up water – Check the pipes for leaks – Request Customer Service
Warning 130 WATER FILTER FOULED	<ul style="list-style-type: none"> – Water filter fouled – Hoseline kinked 	<ul style="list-style-type: none"> – Clean/replace water filter – Straighten kink in hoses
Warning 133 AIR FILTER FOULED	<ul style="list-style-type: none"> – Air filter fouled – Condenser fouled – Air supply or removal obstructed – Air inlet temperature > 45°C – Intake air and waste air "short circuited" 	<ul style="list-style-type: none"> – Clean/replace air filter – Clean condenser – Remove obstructions – Thoroughly ventilate the area with additional fans – Change the set-up location

Alarm	Possible causes	Remedy
Alarm 01 LOW PRESSURE	<ul style="list-style-type: none"> – Refrigerant loss Leakage – Expansion valve (thermal part / nozzle insert) defective 	<ul style="list-style-type: none"> – Request Customer Service
Alarm 02 HIGH PRESSURE	<ul style="list-style-type: none"> – Air-cooled units: – Air filter mats fouled – Condenser fouled – Air supply or removal obstructed – Air inlet temperature > 45°C – Intake air and waste air "short circuited" – Water-cooled units: Water supply or recooling system defective 	<ul style="list-style-type: none"> – Air-cooled units: – Clean/replace filter mats – Clean condenser – Remove obstructions – Thoroughly ventilate the area with additional fans – Change the set-up location – Request Customer Service – Water-cooled units: Check water supply or recooling system – Request Customer Service
Alarm 03 HIGH PRESSURE SAFETY	<ul style="list-style-type: none"> – Air-cooled units: – Air filter mats fouled – Condenser fouled – Air supply or removal obstructed – Air inlet temperature > 45°C – Intake air and waste air "short circuited" – Water-cooled units: Water supply or recooling system defective 	<ul style="list-style-type: none"> – Air-cooled units: – Clean/replace filter mats – Clean condenser – Remove obstructions – Thoroughly ventilate the area with additional fans – Change the set-up location – If necessary, request Customer Service – Water-cooled units: Check water supply or recooling system – Request Customer Service
Alarm 20 FLOW IN MEDIUM CIRCUIT INSUFFICIENT	<ul style="list-style-type: none"> – No water flow or insufficient water flow – Flow meter or pump defective 	<ul style="list-style-type: none"> – Clean/replace water filter – Check hoses for kinks – Request Customer Service
Alarm 50 PROTECTION AGAINST FREEZING	<ul style="list-style-type: none"> – Insufficient water flow (if compressor is in operation) – Ambient temperature too low 	<ul style="list-style-type: none"> – Pumps should be operating at temperatures below 8°C – Heating should be operating at below 4 °C – Request Customer Service
Alarm 71 WATER LEVEL INSUFFICIENT	<ul style="list-style-type: none"> – Water level is too low – Leakage 	<ul style="list-style-type: none"> – Top up water – Check the pipes for leaks – Request Customer Service

If the malfunction cannot be remedied with the aid of this malfunction table or the alarm no. is not contained in this list, please contact the internally responsible maintenance specialist or contact our Customer Service:

support@efcooling.com.

Please provide us with the type and serial number of the unit as well as all alarm numbers that occurred (scroll to the alarm message with the arrow key).

A complete list of the fault messages can be found in Chap. [13.7 PLC manual](#) Troubleshooting requires qualified personnel. Please contact our Support should there be any questions.

8 Inspection and maintenance

8.1 Safety

	<p>Danger Unintentional start-up of the cooling unit can result in considerable danger.</p> <p>Before commencing any inspection and maintenance work, the cooling unit must be switched off at the main switch and secured against being switched back on without authorisation.</p> <p>Non-observance of this instruction can lead to serious physical injury with fatal consequences.</p>
-----------------------------------------------------------------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

	<p>Note Proper execution of the maintenance work is prerequisite for safe and fault-free operation.</p>
-----------------------------------------------------------------------------------	--------------------------------------------------------------------------------------------------------------------

8.1.1 Personnel qualification

This cooling unit must only be inspected and maintained by personnel who fulfil the following requirements:

- Have read and understood Chap. 2 Safety
- Have completed basic mechanical training

8.2 Visual inspection

8.2.1 Tank and medium circuit

Check tank level → if necessary, top up media

Check medium for fouling → if fouled, drain and clean the medium circuit and tank, and fill with new medium.

Check whether medium hoses are kinked → if so, straighten them

8.2.2 Alarms on the display

Press the Alarm key on the display and check that no warnings or alarms are pending
→ For warnings or alarms: see Chap. 7.1.3 Troubleshooting at operator level

8.2.3 Air-cooled cooling units

Inflowing fresh air and outflowing exhaust air must not be restricted. Clean the air filter and condenser if necessary.

	<p>Caution The condenser has razor-thin aluminium fins that can cause injury. Gloves must be worn for cleaning work on the condenser. Non-observance of this instruction can lead to minor physical injury.</p>
-------------------------------------------------------------------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Carefully clean the condenser with compressed air.

	Note The aluminium fins are razor-thin and must not be bent as otherwise proper functioning is no longer ensured.
-----------------------------------------------------------------------------------	------------------------------------------------------------------------------------------------------------------------------------

8.2.4 Water-cooled cooling units

- Check fresh water supply to the cooling unit.
- Check recooling system

8.3 Maintenance schedule

Work required	weekly	monthly	annually
Air-cooled cooling units: Check air filter mats for fouling, clean or replace as required Water-cooled cooling units: Check water supply	X		
Check medium filter for fouling, clean or replace as required	X		
Check tank level , top up medium as required	X		
Inspect medium lines for leaks and kinks		X	
Inspect refrigerant circuit for refrigerant leaks (watch out for traces of refrigerant oil)		X	
Tighten screw clamps in the control cabinet and in the connection boxes of electrical components		X	
Check medium quality , replace medium as required			X
Refill medium circuit / replace media			X

9 Repair

9.1 Safety

	<p>Danger Unintentional start-up of the cooling unit can result in considerable danger. Before commencing any repair work, the cooling unit must be switched off at the main switch and secured against being switched back on without authorisation. Non-observance of this instruction can lead to serious physical injury with fatal consequences.</p>
-----------------------------------------------------------------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

	<p>Note Proper execution of the repair work is prerequisite for safe and fault-free operation.</p>
-----------------------------------------------------------------------------------	---------------------------------------------------------------------------------------------------------------

9.1.1 Personnel qualification

This cooling unit must only be repaired by personnel who fulfil the following requirements:

- Have read and understood Chap. 2 Safety
- Have completed basic mechanical and electrical training
- Authorised to handle refrigerant
(e.g. in Switzerland: Certificate from responsible testing body)

9.2 Replacing air and water filters

9.2.1 Replacing air filters

Remove the fouled filter mat from the frame and insert a new filter mat into the frame. Make sure that the filter mat is positioned flat on the grid and does not make waves.

9.2.2 Replacing the water filter

Undo the filter cup of the water filter with the filter wrench and remove. Make sure that the O-ring doesn't get lost. Replace the water filter with the same type. Make sure that the O-ring sits uniformly in the groove of the filter cup. Screw the filter cup into the filter head. Tighten slightly with the filter wrench.

After switching the cooling unit back on, check the O-ring for leaks. Flow alarms appear if air is expelled from the filters and the lines. Wait one minute to acknowledge the fault. Check the water level. If necessary, top up the water / propylene glycol mixture to the "Max." mark.

9.2.3 Replacing the operating media

To replace the operating medium, see Chap. [4.2.1 Emptying \(frost protection\)](#).

If necessary, clean the tank with a brush and rinse out.

Important sequence for filling the water tank:

1. First remove the filter cup. Fill the tank with fresh medium.
2. Only fill in a mixture of 33 % propylene glycol / 67 % clean water.
3. Insert the new water filter.

Make sure that the O-ring sits uniformly in the groove of the filter cup. Screw the filter cup into the filter head. Tighten slightly with the filter wrench.

After switching the cooling unit back on, check the O-ring for leaks. Flow alarms appear if air is expelled from the filters and the lines. Wait one minute to acknowledge the fault. Check the water level. If necessary, top up the water to the "Max." mark.

9.3 Replacing defective components

Working on and the replacement of components in the refrigerant circuit are only permitted by qualified personnel of a specialist refrigeration company. Observe the legal environmental regulations.

When replacing components in the medium circuit, also empty the cooling unit, see Chap. [4.2.1 Emptying \(frost protection\)](#).

9.4 Troubleshooting at repair level

For a list of warning and alarm messages, possible causes of faults and how to rectify them, see Chap. [13.7 PLC manual](#).

If the malfunction cannot be remedied with the aid of this malfunction table, please contact the Customer Service of your supplier or the Customer Service of Ernst H. Furrer AG directly. The address is given in the chapter [12.1 Address](#).

10 Decommissioning/Storage

10.1 Safety

	<p>Danger Unintentional start-up of the cooling unit can result in considerable danger. Before commencing any disassembly work, the cooling unit must be switched off at the main switch and secured against being switched back on without authorisation. Non-observance of this instruction can lead to serious physical injury with fatal consequences.</p>
	<p>Danger Suspended loads can fall. Never step or remain under suspended loads. Non-observance of this instruction can lead to fatal injury.</p>
	<p>Danger Unsuitable or under-dimensioned lifting gear can break and the load can fall. Only use suitable lifting gear with the required lifting capacity (see weight specifications in "Technical data". Only suspend the cooling unit at the suspension points provided. Non-observance of this instruction can lead to fatal injury.</p>

10.1.1 Personnel qualification

This cooling unit must only be taken out of service and disassembled by personnel who fulfil the following requirements:

- Have read and understood Chap. 2 Safety
- Have completed basic mechanical and electrical training

10.2 Disassembly

First disconnect all energy connections from the cooling unit and secure.

The medium circuit must be completely emptied.

Before any fasteners are undone on the cooling unit, the unit must be secured to prevent it from tipping over. The cooling unit may only be suspended from the suspension straps provided. Only a suitable lifting device, offering the necessary lifting capacity, may be used for this purpose. (See Chap. 4.4 Transport).

10.3 Storage

The cooling unit must be stored on a level surface in a dry, frost-free room. Permissible storage temperatures: -15 °C to +63 °C. If temperatures below -15 °C can occur, the water / propylenglykol circuit must be completely emptied (see Chap. 4.2.1 Emptying (frost protection)).

11 Disposal

11.1 Safety

	<p>Warning The refrigerant in the refrigerant circuit is pressurised. Protective goggles and safety gloves must be worn when working on the refrigerant circuit. Escaping refrigerant can lead to serious injury of the eyes and skin as well as respiratory distress (displacement of oxygen in the air).</p>
-----------------------------------------------------------------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

11.1.1 Personnel qualification

This cooling unit must only be disposed of by personnel who fulfil the following requirements:

- Have read and understood Chap. 2 Safety
- Knowledge of materials
- Knowledge of the hazardous material ordinance

	<p>Note All work on the refrigerant circuit must be carried out by trained refrigeration specialists. Comply with the local laws and regulations.</p>
------------------------------------------------------------------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------

11.2 Procedure

The disposal of the cooling unit and its components must be carried out in accordance with the locally applicable legislation.

After definitive decommissioning of the cooling unit, all components must be taken for professional disposal or recycling in the interest of environmental protection:

- **Refrigerant** (refrigerant circuit) and **refrigerant oil** (compressor) **must** be drained by an authorised refrigeration company and properly disposed of.
- Separate out and sort plastic parts
- Sort metal parts according to type of metal
- Dispose of electrical components in the proper manner

12 Customer Service

Please use the spare parts list for ordering spare and wear parts (see Chap. [13.3 Bill of materials/Spare parts list](#)).

Keep the following information ready for the order in accordance with the nameplate:

- Cooling unit type
- Serial no.
- Year of construction
- Article number and quantity

DECLARACION DE CONFORMIDAD

Declara bajo su única responsabilidad que la máquina, concerniente a tubos de cobre, es conforme a:

- EN 12735-1:2010
- EN 378 / AD 2000

PO

DECLARACAO DE CONFORMIDADE

Declara, sob inteira responsabilidade, que a máquina, em relação aos tubos de cobre, está conforme em:

- Directivas da máquina 2006/42/EC
- EN 378 / AD 2000

SE

FÖRKLARING OM ÖVERENSSTÄMMELSE

Vi försäkrar under vårt enda ansvar att enheten, i samband med kopparrör, är i enlighet med:

- EN 12735-1:2010C
- EN 378 / AD 2000

PL

DEKLARATIA OF CGODNOSCI

Deklarujemy, na naszą odpowiedzialność, że tylko jednostki, związane z miedzi rury, jest zgodne z:

- EN 12735-1:2010
- EN 378 / AD 2000

RUS

Декларацию соответствия

Мы заявляем под свою ответственность, что блок, относящийся к меди Трубы, в соответствии с:

- EN 12735-1:2010
- EN 378 / AD 2000

CN

一致性声明

我们在此声明，本机器的铜导线符合下述准则，我们对此声明完全负责：

- EN 12735-1:2010
- EN 378 / AD 2000

JP

適合宣言書

弊社の責任により、本ユニットは次の事項に適合することを宣言します：

- EN 12735-1:2010
- EN 378 / AD 2000

Type:	WKL 390
Series:	0390.013
Max. allowable pressure in refriger. circuit PS:	28.0 bar
Allowable ambient temperature TS, max./min.:	45 / -15 °C
Performance Pc:	67 kW

Normale Aufstellung Im Gebäude. Frostfreier Raum.
Ausreichender Luftwechsel zur Wärmeabfuhr beachten!

Normal indoor installation. Frost-free space.
Note: Adequate air exchange for heat dissipation!

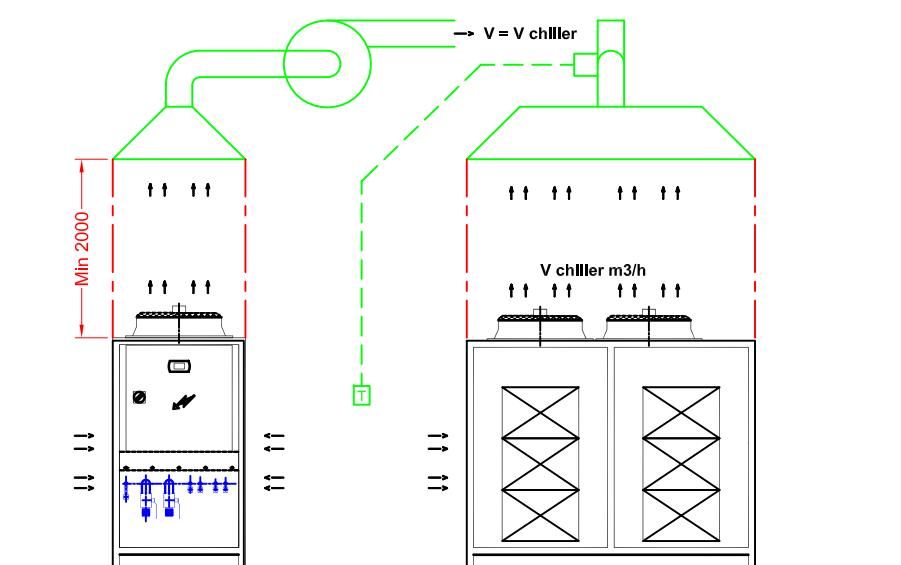

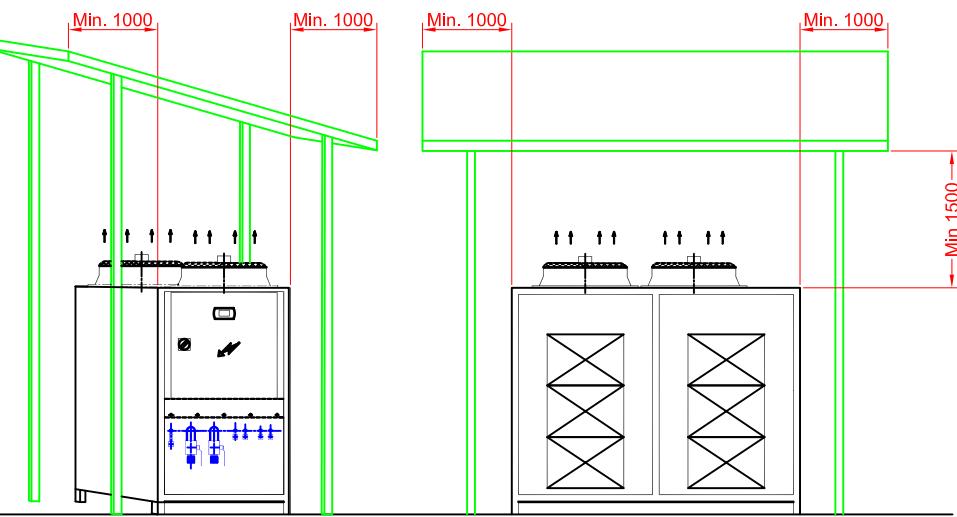

Installation normale à l'Intérieur. Espace sans gel.
Remarque: L'échange d'air suffisant pour la dissipation thermique!

Installazione normale Interna. Spazio al riparo dal gelo.
Nota: ricambio d'aria adeguato per la dissipazione del calore!

Instalación Interior normal. Habitación libre de heladas. Nota: intercambio adecuado de aire para disipar el calor!

Aufstellung Im Freien. Nicht für Alle Anwendungen geeignet! Optionen für Frostschutz beachten! Nur nach Freigabe von efcooling.
Outdoor Installation. Not suitable for all applications! Note: Options for frost protection! Only after approval by efcooling.
Installation à l'extérieur. Ne convient pas pour toutes les applications! Remarque l'option antigel. Seulement après l'approbation par efcooling.
Installazione esterna. Non adatto per tutte le applicazioni! Nota: Opzioni per la protezione dal gelo! Solo dopo l'approvazione di efcooling!
Instalación al aire libre. No es apto para todas las aplicaciones! Opciones para las heladas! Sólo después de la aprobación por parte de efcooling.

Abluftkanal mit externem Ventilator. V = Luftmenge; siehe tech. Daten Kühlergerät.
Exhaust duct. Operation with external fan. V = Airflow; see technical data chiller.
Conduit d'évacuation d'air. Fonctionnement avec ventilateur externe. V = voir données technique app. frigo.
Condotto di scarico dell'aria. Funzionamento con ventilatore esterno. V = vedi dati tecnici chiller.
Conducto de escape de aire. Operación con un ventilador externo. V = consulte datos técnicos enfriador.

Installation plan. Plan d'installation. Aufstellungsplan

Key description

ALARM key

- If the key is flashing (red); one or more alarms / errors are present
- By pressing the alarm key, the display shows all active alarms / warnings.

PRG key

- By pressing the PRG key, the display change to the "Menu overview" display
- If the PRG key is flashing (yellow), a manual mode (manual software shift) is active.

ESCAPE key

- By pressing the ESCAPE key, the display move to the next upper level

UP and Down key

- Scrolling through the „Menu overview“ display.
- Adjustment of a elected set point.

ENTER key

- Select the electet sub menu or confirm and store a adjusted set point.

Illumination of the display background

If the illumination is on, it means that the external release is present (operation mode), otherwise the illumination is off.

the smart way of cooling

Handling "overview" display

Press PRG key → Display move to the „Menu overview“.

Handling „menu overview“ display 1.

Adjust set point:

- Press **ENTER** key once, the cursor jump to the adjustable field.
- Press **UP** or **DOWN** key to adjust the set point.
- With pressing **1 time** the **ENTER** key, the cursor jump back to the home position and the new value is stored.
- With pressing the **ESCAPE** key, the cursor jump back to the home position without storing the value.

Compressor running.

Consumer Pump running.

Condenser Fan running.

Compressor / Consumer Pump /Condenser Fan off.

Compressor / Consumer Pump /Condenser Fan not ready.

Choose sub menu:

Press **UP** or **DOWN** key to move the cursor to the sub menu of your choice.
Press **ENTER** key to switch into the choosen sub menu.
Press the **ESC** key to leave the sub menu and return to the “Overview”.

Menu page

Menu page:

- Press the **ENTER** key to change between the menu parameters
- Press **UP or DOWN** key to change parameter values

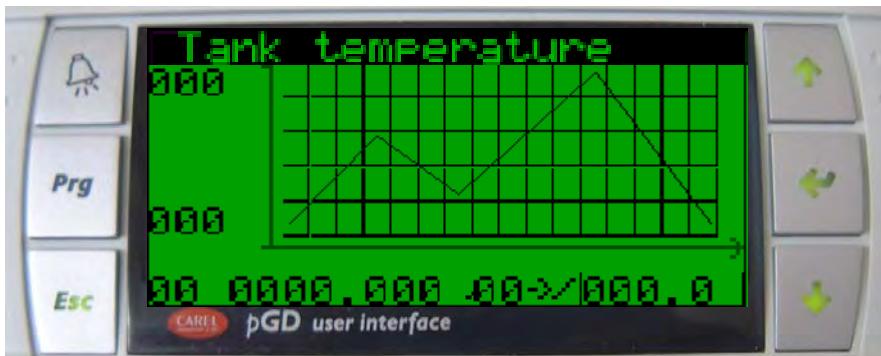

Cooling operation

Press the **ENTER** key to change to the Trend Display

Trend display

Trend Display:

The trend display records an analog value for the displayed length of time. Recording interval and scaling of the measurement value can be set in the parameter setting window of the trend display.

- Press **UP or DOWN** key to change between Trend Display and Parameter Setting display.
- Press the **ESC** key to leave the Trend Display and return to the Menu page.
